1. There is a lot of change in the screens of Anaconda, the RHEL7 installer.
2. The first process started by the kernel was "init" in RHEL6... now it is "systemd".
3. The process "gnome-shell" eats up a lot of CPU time and makes the server sluggish.
4. LVM GUI package is not included in the ISO. The command line LVM is working fine though.
5. The default File System is XFS (upto 500TB). It still supports ext4 (upto 50TB), etc.
6. Citrix Xen hypervisor was expected to be the default in RHEL7, but is missing in this beta version. RHEV is fully supported.
7. Default mount point for removable storage devices is changed from "/media/" to "/run/media/root/".
8. Major functionality changes look to have been done on Virtualization, SELinux, Application isolation using something called "Linux Containers". I need to test its working.
